

Generic

Dan Small pressure maps from POMA August 3, 2007. Image to the left is pressure on a generic hunting cushion. Images below show Dan on the same 3D aspect view along with a 2D view. Pressure distribution is easier to see with the 2D view. Peak pressure was reduced 32% by using the FatBoy. Distribution of pressure improved 17% with the Hunt Comfort FatBoy. It is important to note that Dan fared better on the generic cushion than any of the POMA members tested that day. Dan's weight and frame size was a big factor. Bigger guys tested had much more significant results: pressure decreases of +50% was common and distribution changes were significantly better.
